

Multi-Purpose Interlocking Floor Tiles Are Built To Last!

Quality: Our Multi Purpose tiles use the highest quality PVC materials available — the difference is recognized immediately when you pick up one of our tiles.

Innovation: The Moisture Solution — No matter what climate you live in, at some point in time moisture will have some type of impact on your flooring selection. All competitive PVC floors have either a smooth or square grid underside. The same can be said for rolled PVC mat flooring as well. There is one significant problem inherent with these designs — what happens with moisture when it gets trapped beneath the flooring surface? Whether it is from rain, washing cars, or cleaning out the garage, there is no way you will stop moisture from getting under your rolled flooring or tiles. Our tiles have a moisture combating solution called AirDiy technology that allows airflow to move under the floor, allowing any moisture to evaporate or weep away. Even our trim has the same feature.

Flexibility: Most flooring surfaces are not perfectly level which can be problematic. Our Multi Purpose flooring virtually eliminates this problem with the use of our proprietary formulation - our tiles are flexible and conform readily to the flooring surface, masking many imperfections in your floor.

Strength: Our floor tiles uniquely combine the supple support of finer anti-fatigue products along with the strength to support the weight of vehicles through the structural integrity of our patented design. We have created the best value in the market by combining our innovative designs and our special raw material formulation to achieve optimum performance at an affordable price!

Ease of Installation: Ease of installation is key and our Multi-Purpose flooring is no exception. PVC is much easier to install as it only requires a good utility knife and a rubber mallet. Our 465mm x 465mm tiles also reduce installation time with each tile covering 0.211575 m².

Replacement: Replacing a tile is can be done by simply placing a small flathead screw driver into one of the mushroom interlocks and pulling the tile up. Replacing a damaged tile is incredibly simple and takes very little time or effort.

Cost Efficient: There are many advantages to our patent pending mushroom tooth design, such as an extremely secure interlocking feature. An additional benefit is that there is far less product waste during installation. By having (4) uniform sides you can cut a border piece and in most cases wind up using it in another part of the floor.

Comfort: Very few floor tiles earmarked for garage and multi-purpose applications provide both acoustic and thermal insulation characteristics. Our Multi Purpose floor tiles are robust and quiet to walk on - and best of all it provides great anti-fatigue qualities.
